

GE InSight  
Microservices & APIs

# Solution Context

## Opportunities

Today, functionality in InSight is delivered to GE's customers primarily through GE-developed applications such as InSight Web and InSight mobile applications.

Substantial opportunities exist for GE to **create and market secure, reliable, standards-based Application Programming Interfaces (APIs) for InSight** that will

### Enable GE to:

- **Generate new revenue** streams from GE's existing investments in InSight
- **Market individual capabilities and packages of capabilities** in InSight as subscriptions
- **Gain deep visibility in demand and usage** of individual features and functionality in InSight through usage metering
- **Accurately invoice customers, users, and developers** based on their actual usage of InSight features and functionality

### Enable GE's customers, InSight users, and application developers to:

- **Integrate securely with InSight** through standards-based Web interfaces
- **Incorporate GE InSight functionality into applications** and IT solutions
- **Create new and innovative solutions & applications** built on capabilities and functionality available in InSight
- **Automate human interactions** with InSight to reduce costs and exposure to operational risks
- **Automate reactions to events, trends and alarms** in InSight in order to shorten reaction times and prevent service disruption & outages

Additional opportunities are seen for **enhancements to reporting in InSight**:

- Ability to deliver reports to external systems through standard integration mechanisms (ex: HTTP/S POST)
- Ability to report on data from multiple data sources

# Solution Context

## Goals/Objectives

- Modernize functionality in InSight by transforming existing functionality to cloud-native, hyper-scalable microservices
- Create a secure, scalable API layer which provides GE's customers, InSight users, and developers standards-compliant programmatic access to InSight capabilities and functionality through RESTful APIs
  - Initial focus area for APIs: Reporting
- Enhance InSight reporting to support the following additional use cases:
  - Multiple data sources (through data federation)
  - Delivery of reports to external systems through standards-compliant Web-based integrations: event notifications/web hooks, HTTPS posts, etc.

## Anticipated Outcomes

- Secure, scalable API layer in place
- 100% of GE InSight's reporting capabilities available through secure REST based APIs
- Reporting functionality is elastically scalable, leveraging cloud based infrastructure to automatically scale up and down as required, increasing infrastructure efficiency and reducing exposure to operational risks such as performance problems, scaling challenges, and service unavailability
- Functionality improvements around reporting are in place:
  - Reports are able to leverage data from multiple data sources
  - Reports are able to be delivered to external systems through standard Web based delivery mechanisms
- Continuous Integration and Delivery practices for version control, inspection automation, build automation, test automation, and deployment automation are in place and operational for reporting and for all new services created, minimizing time and manual effort required to deliver new functionality.

Platform Services

Backend Dependencies

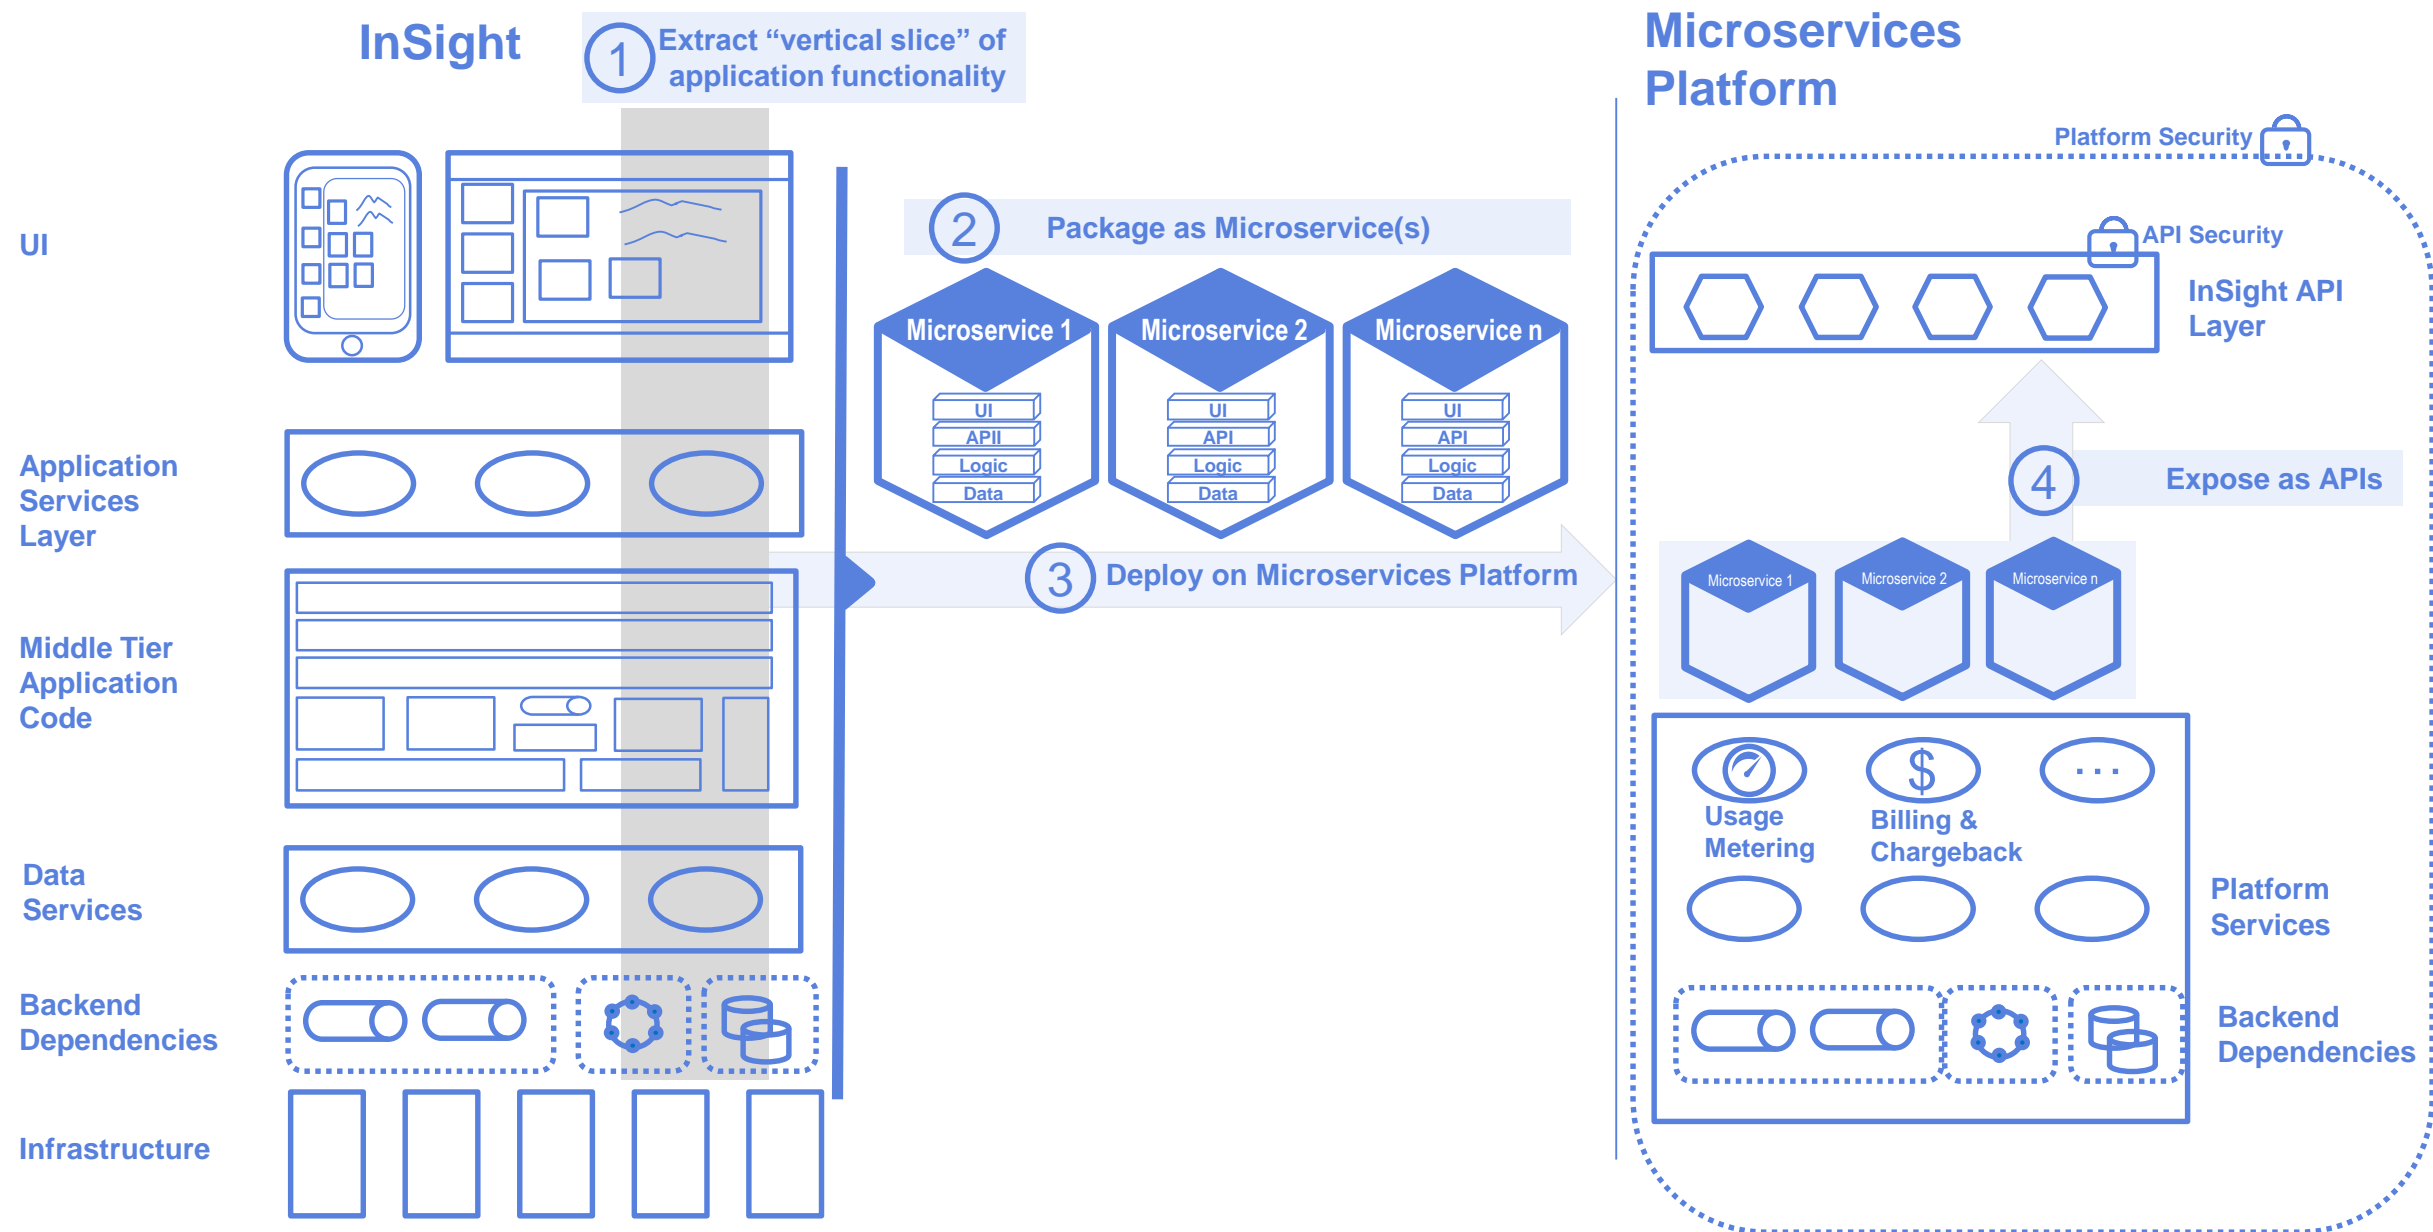

Backend Dependencies

Infrastructure

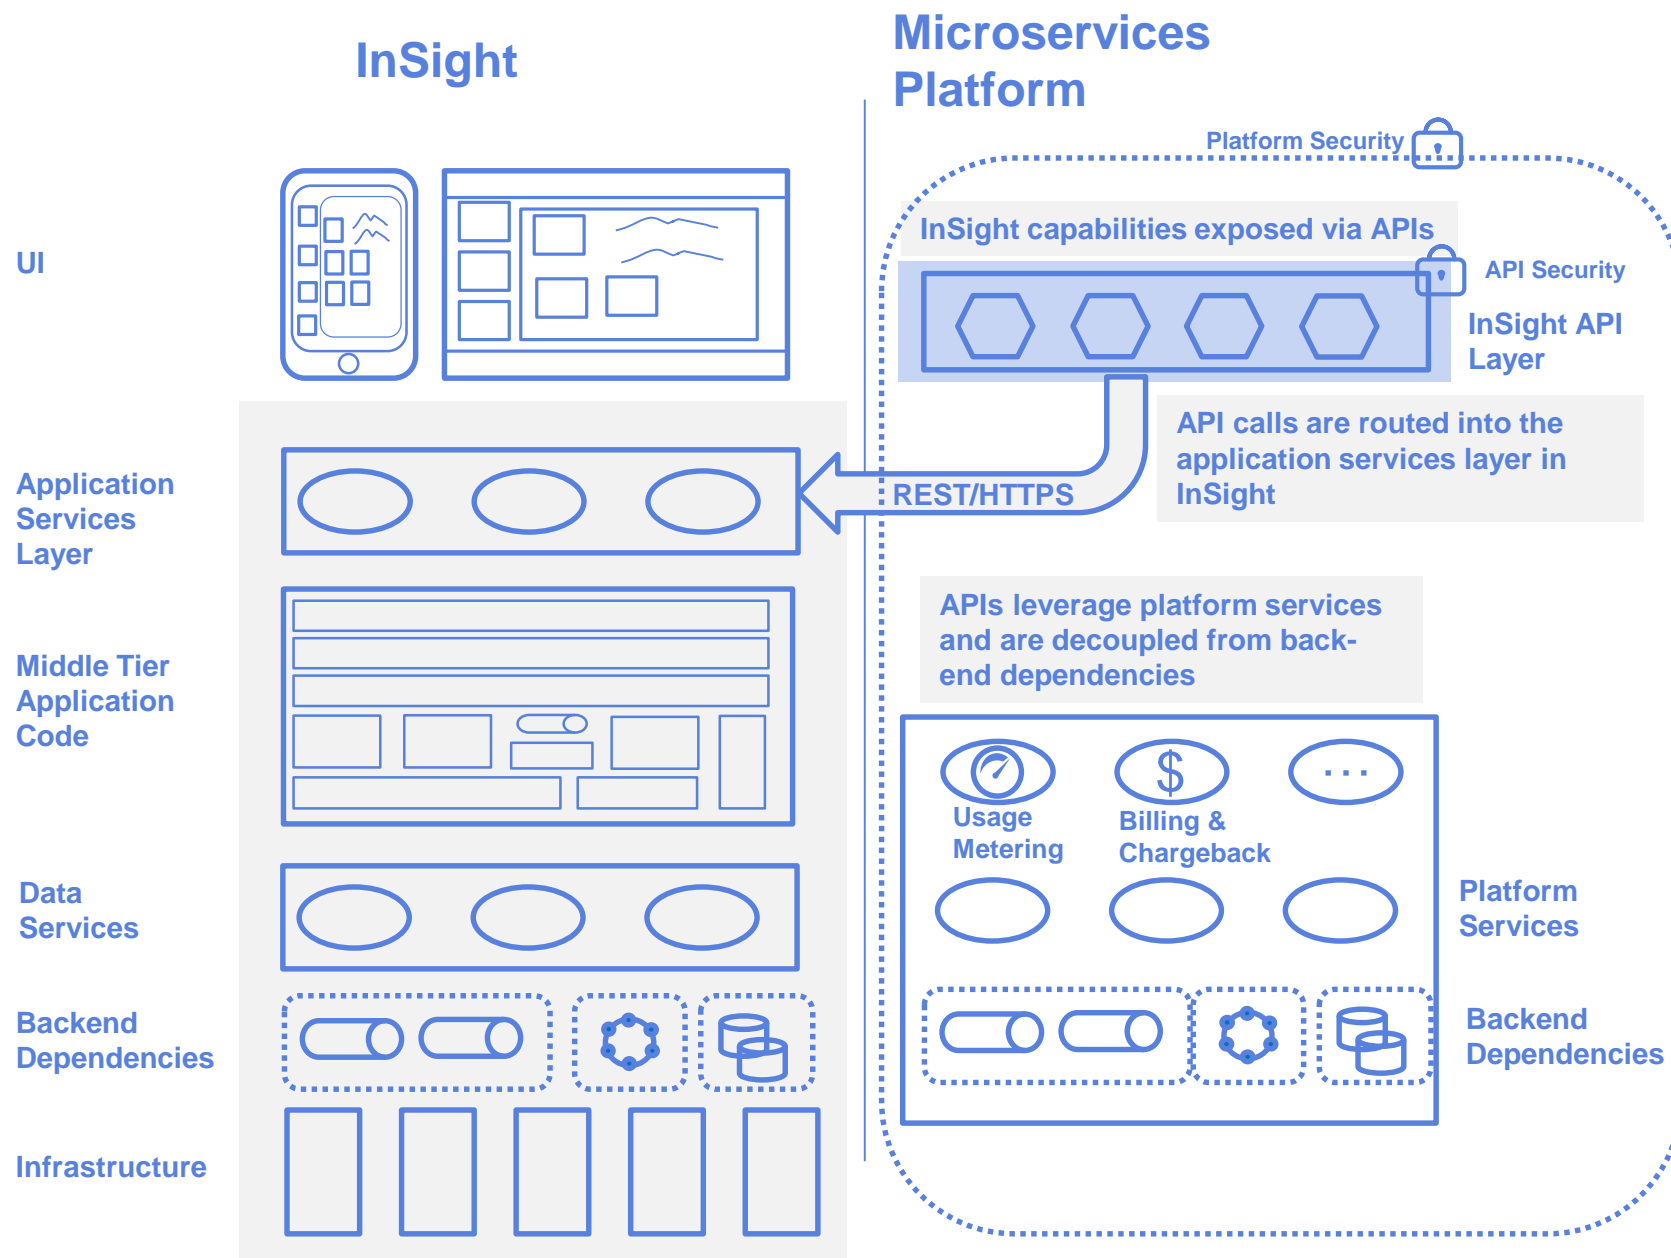

- **APIs enable**
  - Integration with InSight
  - Automation of interactions
  - Automating reactions to alarms, trends, and events
  - 3<sup>rd</sup>-party developers to create innovative solutions
- **Microservices architecture enables:**
  - Rapid, low impact evolution & replacement
  - Robust fault isolation
  - Deployment automation & flexibility
  - On-Demand Scalability
  - Small Testing Scope
  - Simple Optimization
  - Flexible Versioning
  - Shortened time-to-value
- **Standardized platform services enable and simplify:**
  - Security management
  - API Subscription management
  - Usage Metering
  - Chargeback & Billing
- **Cost efficiency is improved** by leveraging cloud computing economies of scale and reducing the need to manually operate and maintain server infrastructure

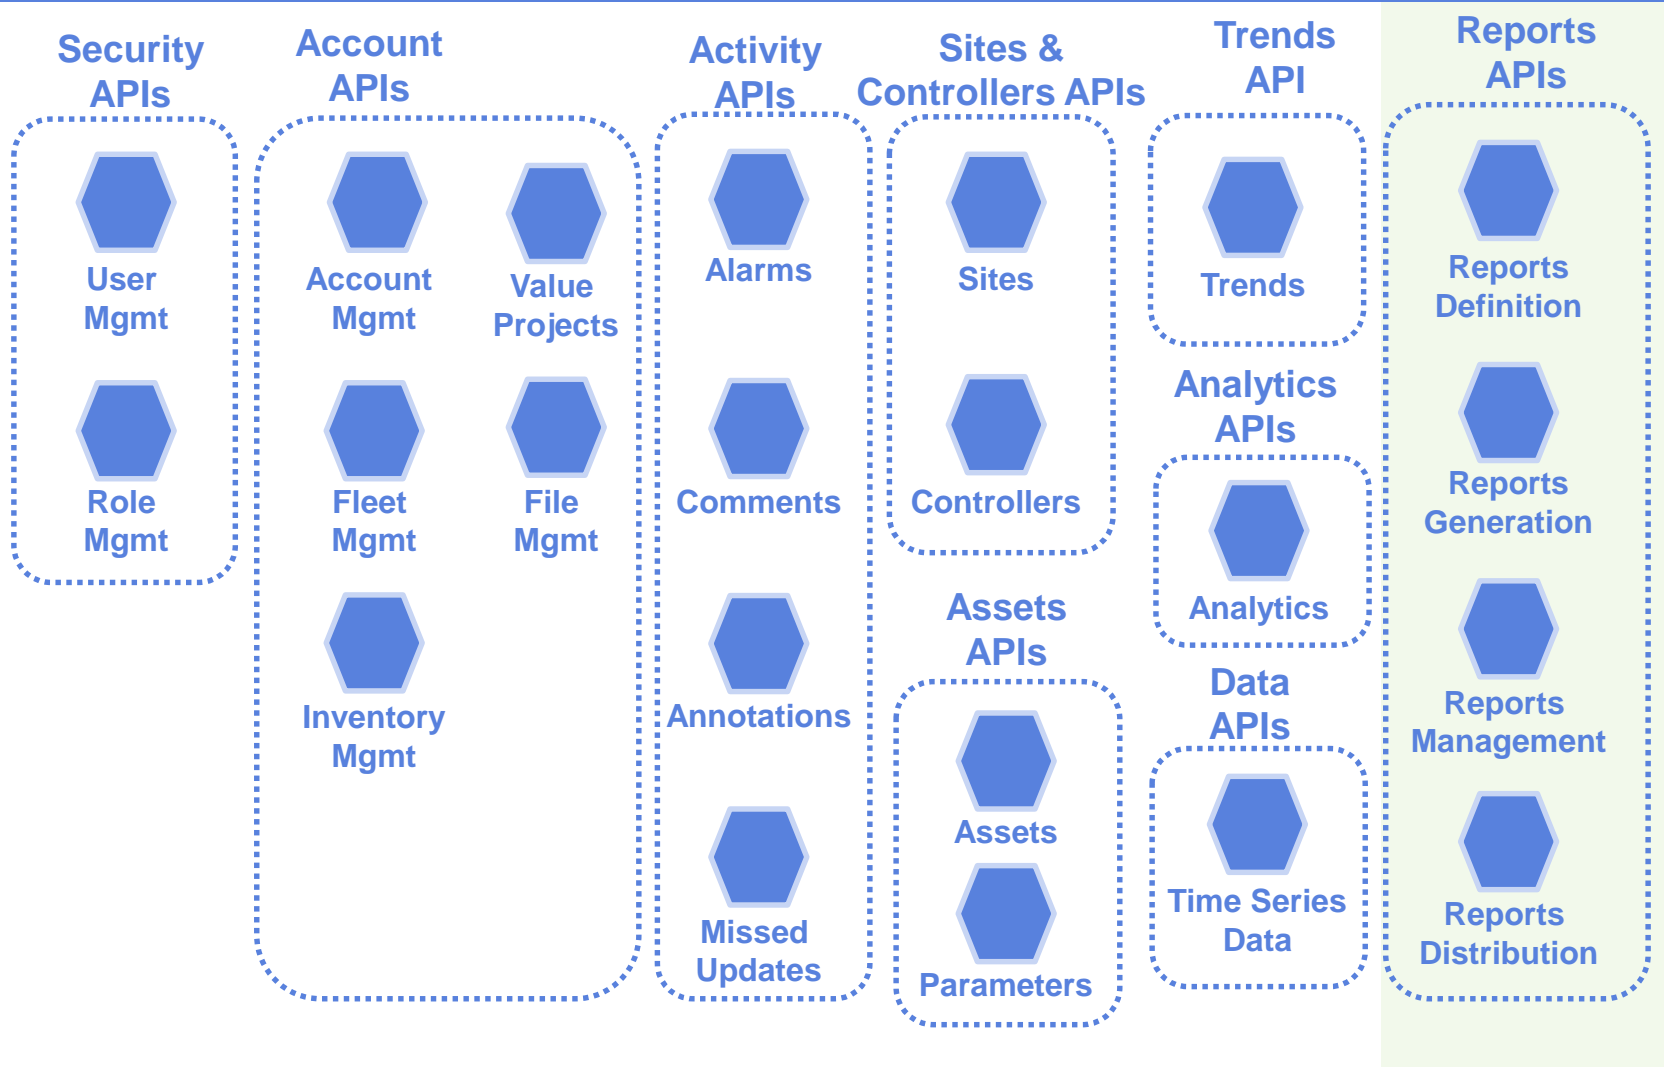

# Microservices Transformation Process

# InSight API Layer

# InSight API Opportunity Landscape

**Initial  
Focus Area**

## Rationale

- **Fast time to value**
- **Low Risk** of undesirable “ripple effects” of changes due to high cohesion and loose coupling in reporting today
- **Changing anyway:** Need to touch reporting anyway to add desired enhancements
  - Multiple data sources
  - Reports delivery via standard web mechanisms (HTTP POST)
- **Opportunities to gain scalability improvements at same time**
  - Report metadata currently stored in Oracle; migrating to scalable database will **support larger customer base**
  - Generated reports are currently stored in network file storage; S3-like BLOB storage preferred for achieving true Web scale

# Reporting User Stories

As a GE InSight user,

I want to be able to author, generate, view and schedule reports that incorporate data from multiple data sources,

So that my reports can utilize information residing in many different data stores,

Whereas today, I can only report on data contained in GE InSight.

As an application developer,

I want a set of easy-to-consume, well-crafted, well-documented, secure & scalable APIs that expose GE InSight's rich reporting functionality

So that I can build new and innovative applications and features that incorporate the powerful reporting capabilities available in GE InSight,

Whereas today, these capabilities of GE InSight are not available through APIs.

As a GE InSight user,

I want GE InSight to be able to automatically upload reports into my Web-connected system(s)

So that my GE InSight reports are automatically available in the systems I need them to be

Whereas today, delivery to my systems over HTTPS POST is not supported

# Team Structure

Role	Responsibilities and Locations	Skill Sets and Experience
<b>Microservices Architect</b>	<p><b>Responsibilities:</b></p> <ul style="list-style-type: none"> <li>Provide Cloud, Microservices, and Java design and development best practices</li> <li>Provide Subject Matter Expertise in Microservices development and deployment</li> </ul> <p><b>Location:</b></p> <ul style="list-style-type: none"> <li>1 Resource On-Site supported additionally from UST Cloud Architecture Practice</li> </ul>	<p><i>Key role – master of everything</i></p> <ul style="list-style-type: none"> <li>Must have minimum 10 years of IT experience</li> <li>Cloud Foundry expertise</li> <li>Proficient in API Design concepts and best practices for RESTful service design</li> <li>Expert level Java EE. Java EE certification preferred</li> <li>Must be familiar with Python, PHP, HTML5, and AngularJS</li> <li>Expert level at modern software paradigm, e.g., single page applications</li> <li>Must have solid understanding of 12 factor principle and self-contained systems (SCS)</li> <li>Expert level DevOps Automation - automate continuous integration and enable continuous delivery - build/deployment automation</li> <li>Must be able to development reusable frameworks, components, and templates</li> <li>Must be able to recognize the structural and behavior patterns and have the judgment to apply the appropriate solution patterns</li> <li>Must be competent in agile development and team tools setup and configurations</li> <li>Define requirements/Acceptance Criteria definition &amp; refinement for early sprints</li> <li>Identify development tools, standards, and guidelines</li> <li>Setup tools, assets, APIs repositories</li> <li>Must have great communication skills to all levels of stakeholders</li> </ul>
<b>Technical Product Owner/ Technical Lead</b>	<p><b>Responsibilities:</b></p> <ul style="list-style-type: none"> <li>Leads software engineering team in creation of cloud-native solutions</li> <li>Hands-on member of the engineering team building the solution</li> <li>Iteration planning, managing and coordinating product and iteration backlog</li> <li>User Story elaboration</li> <li>Acceptance criteria development for complex</li> </ul> <p><b>Location:</b></p> <ul style="list-style-type: none"> <li>1 Resource On-Site</li> </ul>	<ul style="list-style-type: none"> <li>Must have 8-10 years IT experience</li> <li>Strong background in leading top performing software development/engineering teams</li> <li>Must have expert level knowledge of agile development</li> <li>Must have experience with Cloud Foundry, Java EE, DevOps, CI/CD</li> <li>Must be familiar with Python, PHP, HTML5, and AngularJS</li> <li>Must be a team builder, team enabler, and conflict competent</li> <li>Must possess organizational dynamics awareness and be able to tackle challenging incidents gracefully</li> <li>Define requirements/Acceptance Criteria definitions &amp; refinements</li> <li>Must be expert at user story elaborations</li> <li>Expert understanding of API design principles</li> <li>Strong understanding of API strategy from a business and technical perspective including API marketing, usage metering, API subscription management, API billing &amp; chargeback, etc.</li> <li>Must have great communication skills to all levels of stakeholders</li> </ul>

# Team Structure (cont'd)

Role	Responsibilities and Locations	Skill Sets and Experience
<b>Software Dev Engineers</b>	<b>Responsibilities:</b> <ul style="list-style-type: none"> <li>Develop defined Microservices</li> <li>Develop Unit tests, integration tests, acceptance tests, consumer-driven contract tests</li> <li>Support Quality Assurance efforts</li> </ul> <b>Location:</b> <ul style="list-style-type: none"> <li>4 Software Development Engineers On-site</li> </ul>	<ul style="list-style-type: none"> <li>Must have 6-8 years IT experience</li> <li>Must have experience agile development</li> <li>Must have experience with Cloud Foundry, Java EE, DevOps, CI/CD</li> <li>Must be familiar with Python, PHP, HTML5, and AngularJS</li> <li>Must have a solid understanding of microservices architectures, challenges, and solution patterns</li> <li>Strong experience in RESTful API design and implementation</li> <li>Must be able to understand requirements and be able to deliver code consistent with requirements, architecture, development standards and guidelines</li> <li>Must be competent in automated unit testing, automated integration testing, automated acceptance testing – TDD, BDD, ATDD</li> </ul>
<b>SDETS( Software Dev Engineers in Test)</b>	<b>Responsibilities:</b> <ul style="list-style-type: none"> <li>Functional and non-functional testing of Microservices, APIs, and cloud native solutions</li> <li>Guides overall test methodology and best practices</li> </ul> <b>Location:</b> <ul style="list-style-type: none"> <li>2 SDETS On-site</li> </ul>	<ul style="list-style-type: none"> <li>Must have 6-8 years IT experience</li> <li>Similar level of skills and background as Software Dev Engineer skillset above, with additional specialty and depth of experience in automated and manual testing</li> <li>Mentors software development engineers in implementing automated testing practices at all levels within a cloud native solutions architecture</li> <li>Must be able to validate software against specifications</li> <li>Must be able to setup test environment</li> <li>Must be able to setup configurations for various environments</li> <li>Must be able to create and execute automated tests against complex microservices architectures and test services in-depth</li> <li>Must be self-starter</li> </ul>
<b>Cloud Infra Architect</b>	<b>Responsibilities:</b> <ul style="list-style-type: none"> <li>Provisioning and configuration of compute instances</li> <li>Setting up perimeter and endpoint connectivity, routing, and security</li> <li>Migrating server, middleware, application, and service workloads to IaaS</li> <li>Establishing effective cloud-scale logging, monitoring, audit trails and operational dashboards</li> </ul> <b>Location:</b> <ul style="list-style-type: none"> <li>1 Cloud Architect On-site</li> </ul>	<ul style="list-style-type: none"> <li>Must have 6-8 years cloud infrastructure experience with strong experience in architecting cloud first applications on Microservices Platform; expert in provisioning, application deployment and data migration on Cloud Platform</li> <li>Designs high availability applications on the Cloud platform across availability zones and availability regions</li> <li>Deep knowledge of monitoring, logging and cloud management tools</li> <li>Experienced in provisioning and configuration management tools like Ansible, SaltStack, Chef, Puppet</li> <li>Excellent experience in REST API design and documentation</li> <li>Knowledge of Hadoop, Kafka, Spark, etc.</li> <li>Knowledge of Lucene/Solr, Elastic Search, etc.</li> <li>Deep knowledge of the internals of PaaS platform, like Cloud Foundry, other leading PaaS solutions</li> <li>Hands-on experience in PostgreSQL, Cassandra, Redis, Zookeeper</li> </ul>

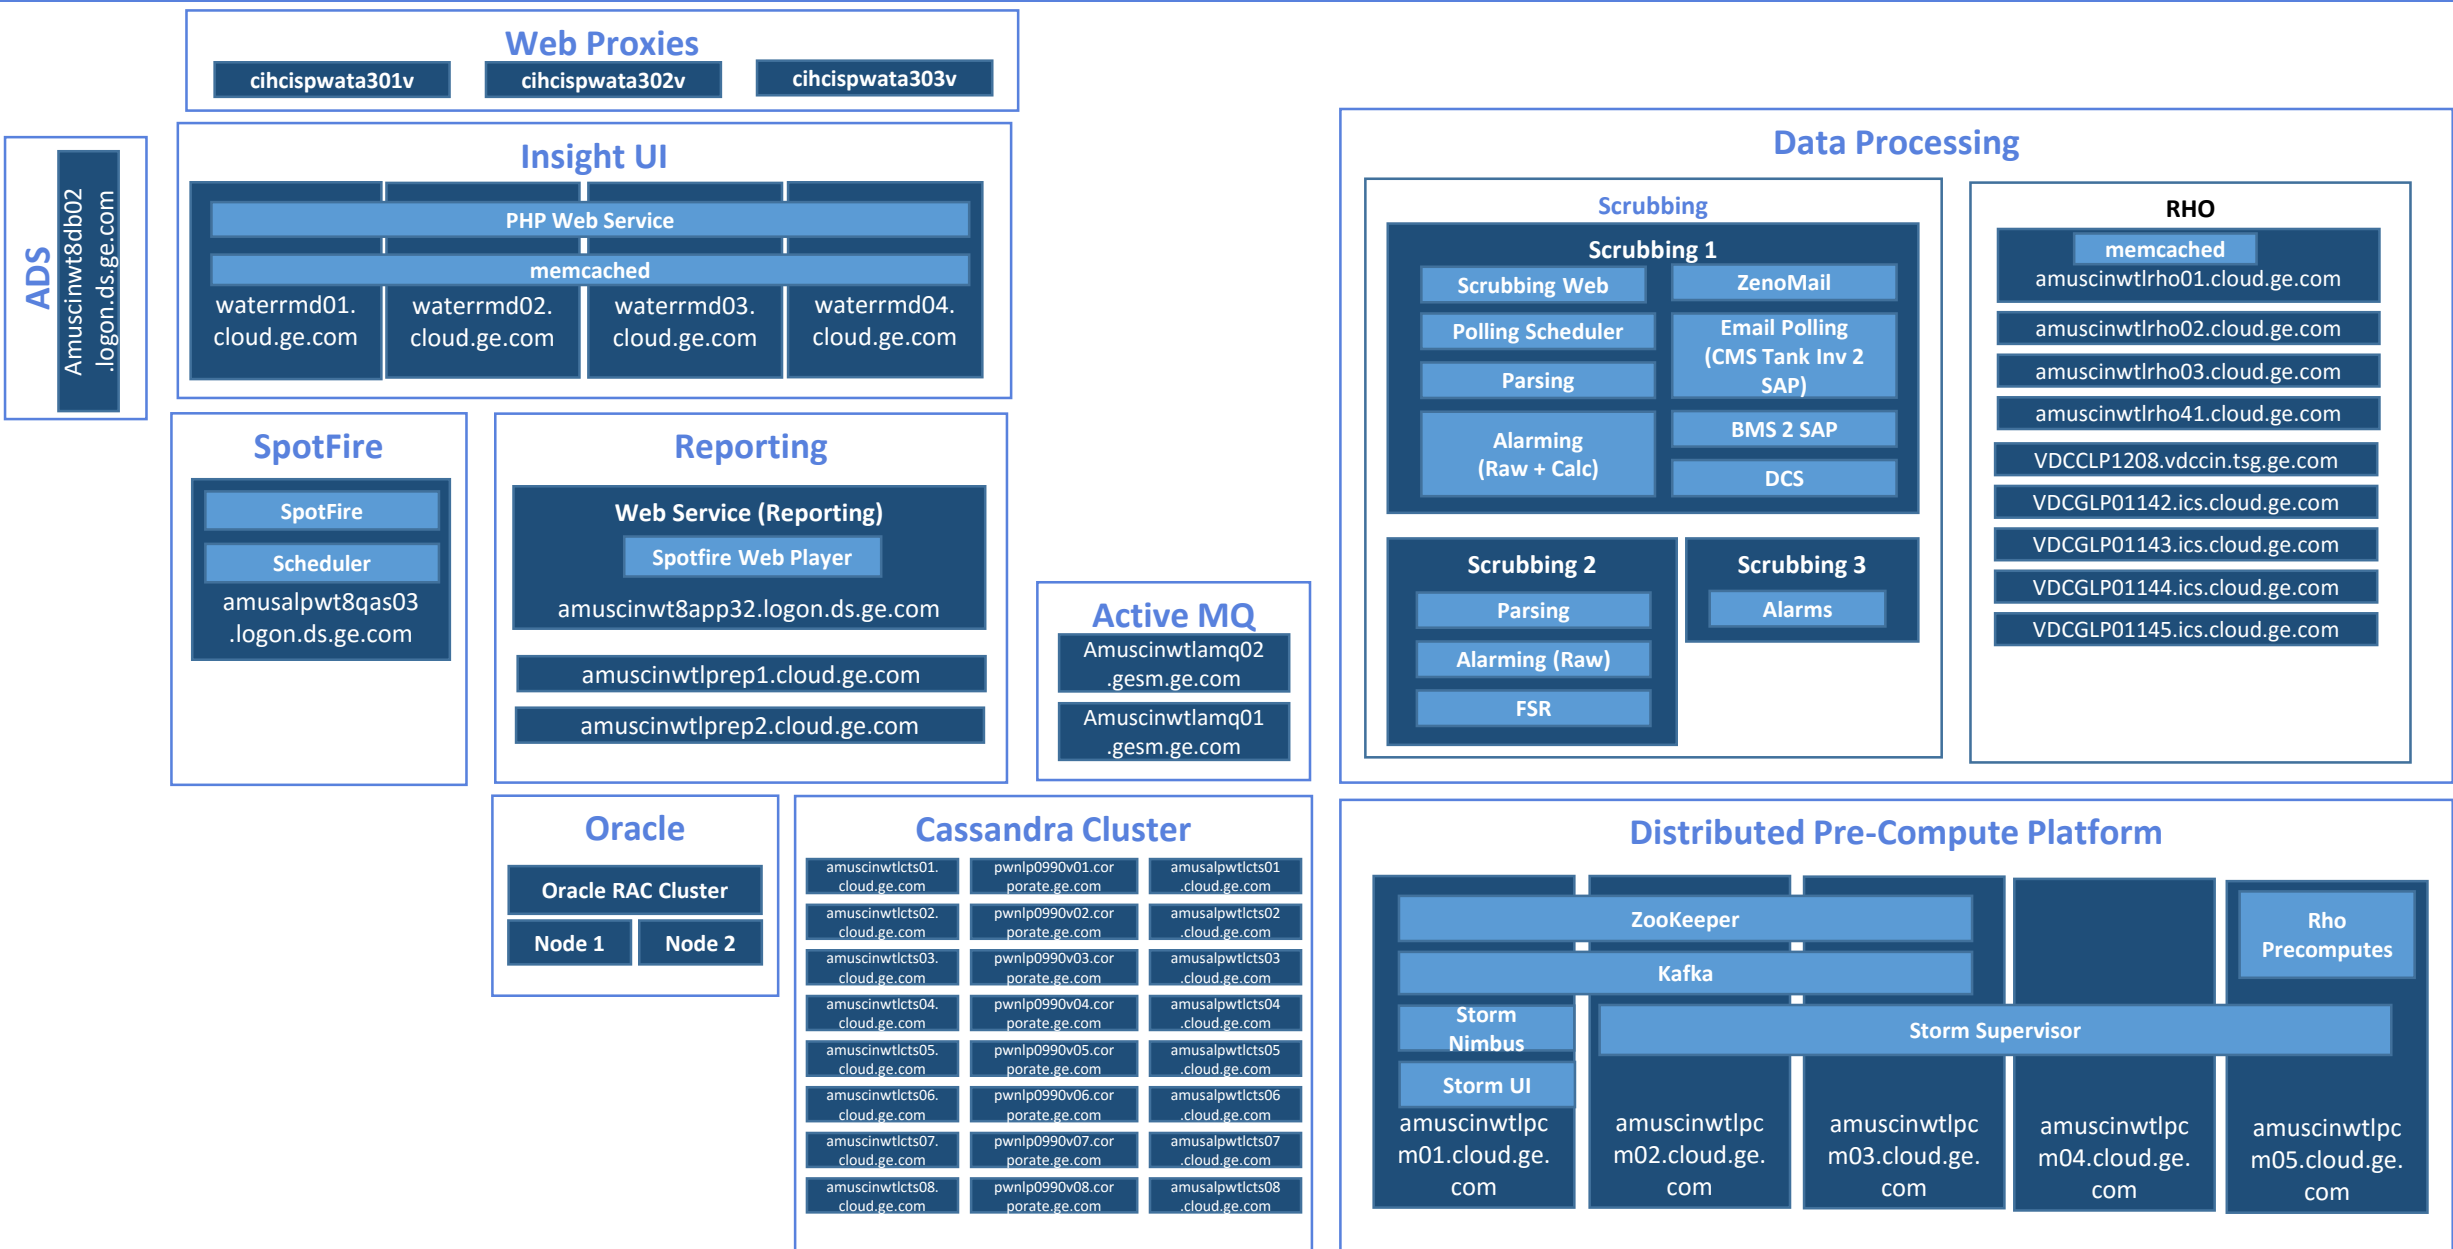

imagination at work

# Appendices

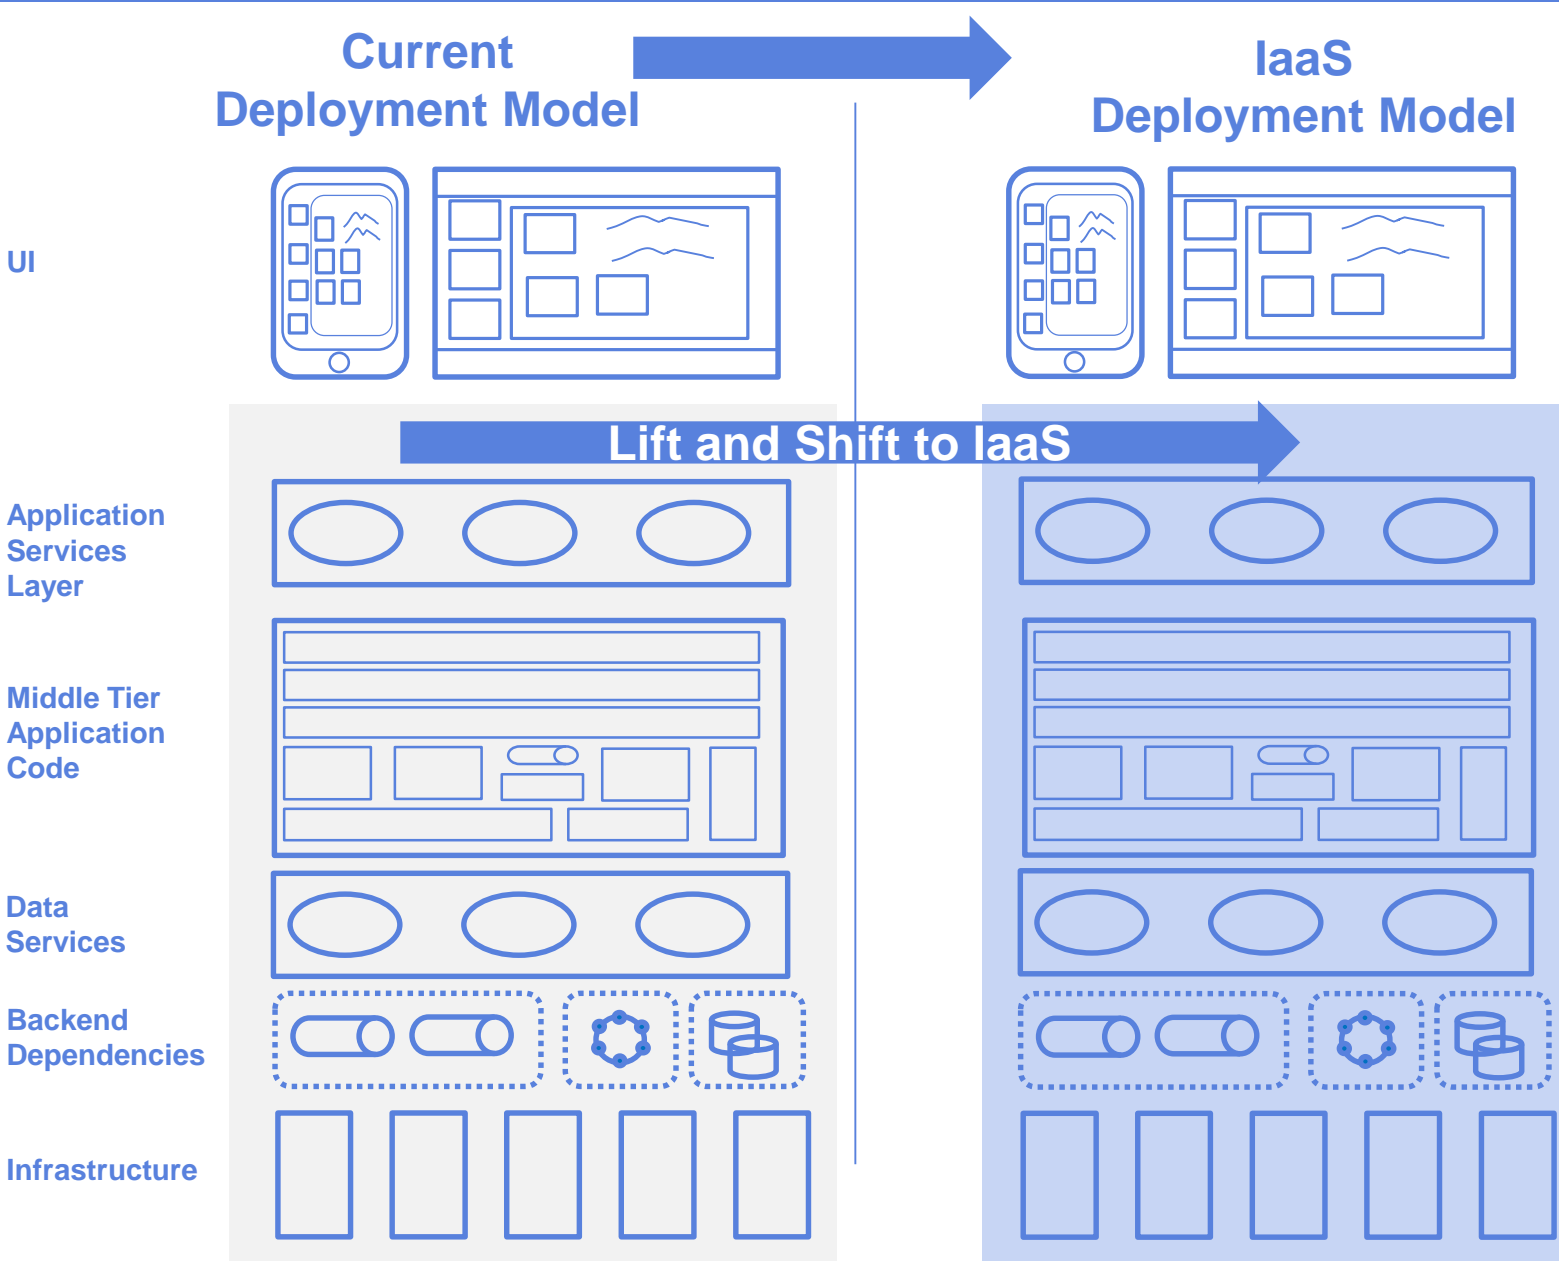

imagination at work

# Current InSight Infrastructure (Production)

# Lift & Shift to IaaS

## Benefits

- Reduce infrastructure costs by leveraging cloud computing economies of scale
- Enable greater scale
- Minimal application changes required

## Challenges

- Paradigm shift, requires new
  - Tools
  - Governance
  - Skills & Operational Experience
- Security concerns in public cloud
  - Perimeter security
  - Endpoint security
  - Multi-tenancy
  - Securing data at rest
- Additional challenges
  - Complexity
  - Transparency
  - Control

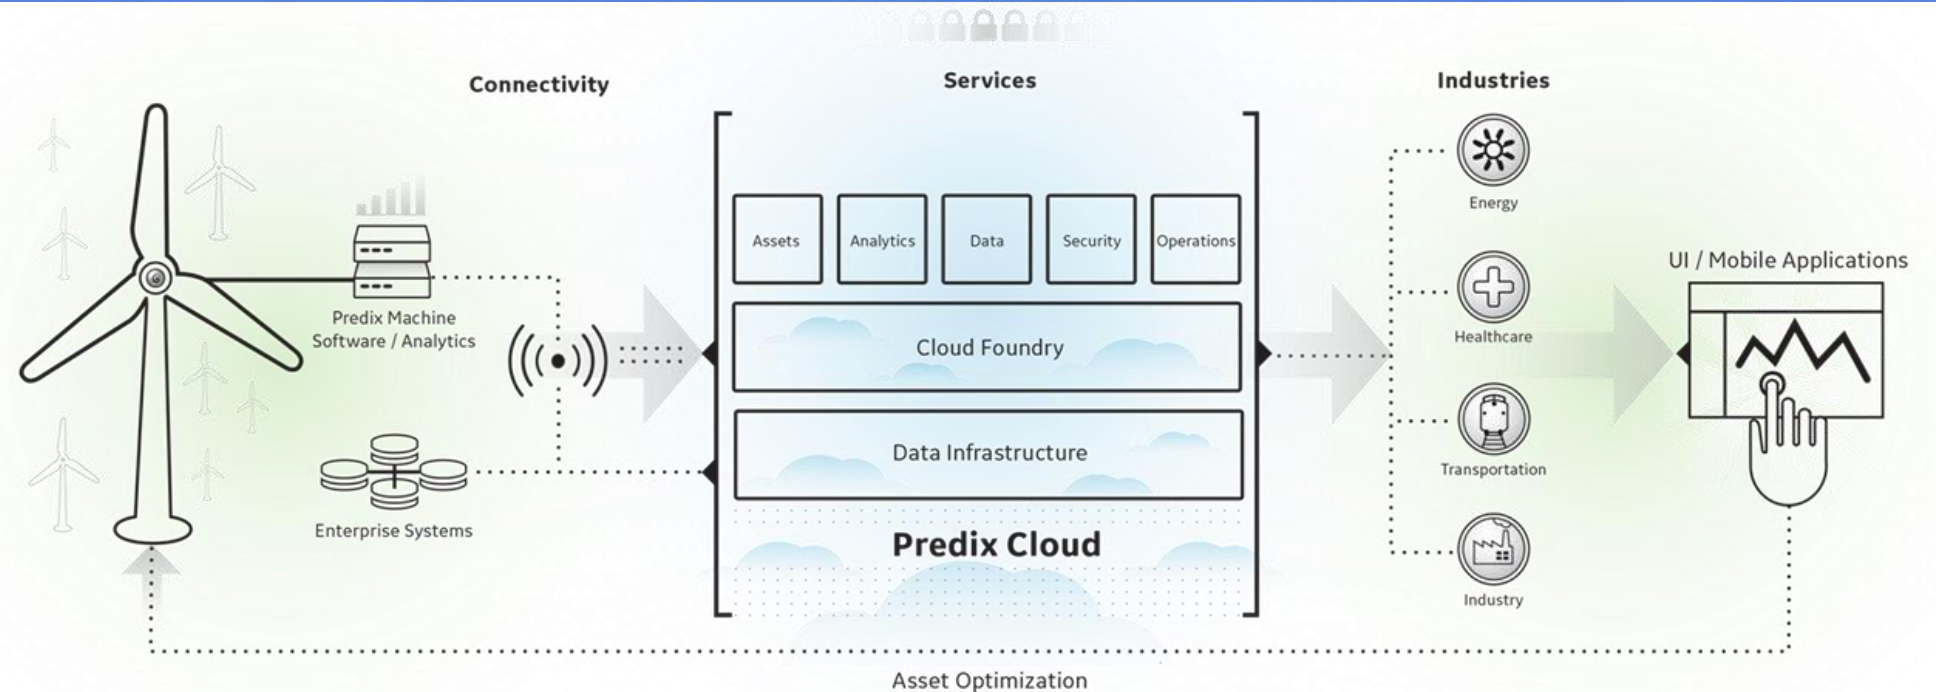

## Drawbacks

- Still need to manage and operate infrastructure

# Predix Cloud Platform

- Platform for future of all GE applications and services
- Built on Pivotal Cloud Foundry PaaS
- Microservices-based architecture
- Pre-built templates & accelerators
- UI components for Web & Mobile
- Rich services ecosystem

<b>Data Management Services</b> <ul style="list-style-type: none"><li>• <b>Asset Data</b> - create and store machine asset models</li><li>• <b>Time Series</b> - Manage, ingest, store and analyze data</li><li>• <b>SQL Database</b> - PostgreSQL</li><li>• <b>Key-Value Store</b> - redis - key-value cache and store</li><li>• <b>AMQP</b> - RabbitMQ - messages between apps, components and devices</li><li>• <b>Blobstore</b> - Binary large object storage</li></ul>	<b>Security Services</b> <ul style="list-style-type: none"><li>• <b>User Account &amp; Authentication</b></li><li>• <b>Access Control Service</b> - Robust access control</li><li>• <b>Tenant Management</b> - instance provisioning for tenants and runtime access</li></ul>	<b>Analytics Services</b> <ul style="list-style-type: none"><li>• <b>Analytics Catalog</b></li><li>• <b>Analytics Runtime</b> - elastic execution</li><li>• <b>Analytic User Interface</b> - to upload, validate, and run analytics</li><li>• <b>GeoEnhance</b> - pitney bowes - for location services</li></ul>
